

I claim:

1. A pressure-inducing device for use in tactical procedures comprising a linear shaped bar having a first and a second end, said bar having a tapered shape at the first end and an end cap attached to said first end, such that said end cap is used as the contact point to induce pressure to an individual's body at a desired location.

5  
2. The pressure-inducing device as described in claim 1 further comprising a handle attached to the bar at a location in close proximity to said second end of said bar, said handle used to control of the device.

10

3. The device as described in claim 1 wherein taper is approximately 25 degrees.
